

Can Kaspersky Internet Security version 6.0/7.0 be installed on an already infected PC and remove malicious software already loaded in RAM?

Concerning to:

□ **Kaspersky Internet Security 6.0 MP2 (version 6.0.2.614)**

New technology **Advanced Definition** of removing malicious software already active is deployed in **Kaspersky Anti-Virus** version **6.0**.

The technology can remove malicious software that already loaded in RAM and can reload themselves and prevent the anti-virus software using harmful methods.

Upon detection a malicious code, the application prompts the user the following procedure to delete a malicious code:

- Block all new system processes from launching
- Block all actions with the registry start-up keys. Block creation of new files in the start-up folders.
- Block creation of new executable files;
- Start of the scan start-up task and disinfection/deletion of the required malicious code
- System reboot;
- System load without a malicious code already
